

NAME:T.RAMYASRI

H.NO:2303A52136

TASK-1:

Prompt:

The function enforces all rules explicitly, ensuring structural correctness with regex and edge case checks. Unit tests validate both valid and invalid scenarios, guaranteeing reliability. Thus, the solution robustly distinguishes proper emails from malformed ones.

CODE:

```
import re

# -----
# Email Validation Function
# -----
def is_valid_email(email):
    # Must not be empty
    if not email:
        return False

    # Must contain exactly one '@'
    if email.count('@') != 1:
        return False

    # Must contain at least one '.' after '@'
    at_index = email.find('@')
    if '.' not in email[at_index:]:
        return False

    # Must not start or end with special characters
    if not email[0].isalnum() or not email[-1].isalnum():
        return False

    # Proper email pattern check
    pattern = r'^[A-Za-z0-9][A-Za-z0-9._]*@[A-Za-z0-9.-]+\.[A-Za-z]{2,}$'
    return re.match(pattern, email) is not None

# -----
# AI Generated Test Cases
```

```

# -----
# AI Generated Test Cases
# -----
test_cases = [
    # Valid Emails (Should PASS)
    ("test@example.com", True),
    ("user.name@gmail.com", True),
    ("user123@domain.co.in", True),

Total Failed: 0
PS C:\Users\ramya\OneDrive\Desktop\coding>
```

JUSTIFICATION:

This task ensures reliable email input validation in a user registration system by applying Test-Driven Development (TDD).

Test cases were first created to cover both valid and invalid email formats, including edge cases such as multiple @ symbols, missing . characters, and improper starting or ending characters.

The `is_valid_email(email)` function was then implemented to satisfy all specified requirements.

This approach improves software reliability, prevents incorrect user data entry, and ensures that only properly formatted email addresses are accepted. All generated test cases pass successfully, confirming the correctness of the implementation.

TASK-2:

PROMPT:

Develop a Python function `is_valid_email(email)` that validates email addresses based on given rules.

Write unit tests to cover valid and invalid formats using TDD. Ensure all tests pass and outputs match expected results.

Code:

```
# -----  
# Grade Assignment Function  
# -----  
def assign_grade(score):  
    if not isinstance(score, (int, float)):  
        return "Invalid Input"  
  
    if score < 0 or score > 100:  
        return "Invalid Input"  
  
    if 90 <= score <= 100:  
        return "A"  
    elif 80 <= score < 90:  
        return "B"  
    elif 70 <= score < 80:  
        return "C"  
    elif 60 <= score < 70:  
        return "D"  
    else:  
        return "F"  
  
# -----  
# AI-Generated Test Cases  
# -----  
test_cases = [  
    # Valid cases  
    (95, "A"),

Test Case 11: Input = 105 → PASSED
Test Case 12: Input = eighty → PASSED

-----
Total Passed: 12

```

Justification:

This task implements an automated grading system using a Test-Driven Development approach. Test cases were created first to cover normal scores, boundary values, and invalid inputs. The `assign_grade(score)` function was then implemented to correctly assign grades and handle invalid data gracefully. All test cases pass successfully, ensuring accuracy and reliability of the grading system.

TASK-3:

PROMPT:

Develop a Python function `assign_grade(score)` to classify scores into grades A–F. Include boundary values (60, 70, 80, 90) and invalid inputs (-5, 105, "eighty"). Write unit tests to ensure all cases pass using a TDD approach.

```
1  import string
2
3  # -----
4  # Palindrome Function
5  # -----
6  def is_sentence_palindrome(sentence):
7      # Remove spaces and punctuation, convert to lowercase
8      cleaned = ""
9
10     for char in sentence:
11         if char.isalnum(): # Keep only letters and numbers
12             cleaned += char.lower()
13
14     # Check if cleaned sentence equals its reverse
15     return cleaned == cleaned[::-1]
16
17
18 # -----
19 # AI-Generated Test Cases
20 # -----
21 test_cases = [
22     ("A man a plan a canal Panama", True),
23     ("Madam In Eden I'm Adam", True),
24     ("Was it a car or a cat I saw?", True),
25     ("Hello World", False),
26     ("Python Programming", False),
27     ("No lemon, no melon", True),
28     ("12321", True),
29     ("12345", False)
30 ]
31
```

```

Test Case 8: "12345" → PASSED

-----
Total Passed: 8
Total Failed: 0
PS C:\Users\ranya\OneDrive\Desktop\coding>
```

JUSTIFICATION:

This task implements a sentence palindrome checker using a test-driven approach. The function removes spaces, punctuation, and ignores case before checking whether the sentence reads the same forward and backward. Test cases include both palindromic and non-palindromic sentences to ensure accuracy. All generated test cases pass successfully, confirming correct functionality.

TASK-4:

PROMPT:

Develop a Python function `is_sentence_palindrome(sentence)` that checks if a sentence is a palindrome.

Ignore case, spaces, and punctuation when validating.

Write unit tests to confirm correctness for palindromic and non-palindromic sentences

```
# -----  
# ShoppingCart Class

PS C:\Users\ramya\OneDrive\Desktop\coding> 
```

JUSTIFICATION:

This task implements a basic ShoppingCart class to simulate core e-commerce functionality. The system allows adding items, removing items, and calculating the total cost accurately. Test cases were generated to verify correct behavior, including handling empty cart and removing non-existing items. All tests pass successfully, ensuring the reliability and correctness of the shopping cart module.
